

Hi,

ERP5 uses [ZODB](#) as its main database. It is slowly transitionning to our homebrewed [NEO](#) storage, which is a distributed database following the same API and implementing the same features as ZODB.

Also, <https://mariadb.org/> is used as a catalog of ZODB/NEO, indexing the most commons and shared properties of all ERP5 documents and their fulltext representation, in order to easily and fastly query the ZODB/NEO storage.

Regards,

Nicolas
