

For some reason I wasn't logged in. Anyway, the post above is mine.

I followed the <https://www.erp5.com/slapos-Tutorial.Install.Slapos.Node.Comp.0> instructions.

I can only get up to "Instantiation and Port Forwarding".
The Frontend instance is red and just says 'start requested'

When I check the slapos-node-instance.log I just see the following repeating:

Processing computer partitions...

Supervisord already running.

Finished computer partitions

Loading: /etc/opt/slapos/slapos.cfg

Sleeping for 12 seconds. To Disable this feature, check --now parameter in slapgrid help.

I can confirm the frontend software is correctly installed on the node and is green. It just won't deploy the instance.

I've tried restarting both the master and slave nodes.

On the node I've deleted all the slapparts and popped in a fresh format as well as alter_user to recreate the user permissions.

Is there a particular log on the master to see why it's not sending out the instance to the node?
