Hello,

the script to deploy ERP5 on Debian 10 is now working fine but the problem is that the installation of slapos in your machine is broken (it still tries to install older software that will never work). The simplest is to reinstall the machine fully. Otherwise, you could do the following commands:

```
rm /tmp/playbook*
rm -rf /tmp/tmpplaybook*
rm /etc/cron.d/ansible*
slapos node stop slapproxy
rm /opt/slapos/slapproxy.db
rm -rf /opt/slapgrid
rm -rf /srv/slapgrid
slapos node start slapproxy
# then start the installation again
wget https://deploy.erp5.net/erp5-standalone
bash erp5-standalone
```

For information (especially for Yusei), the standalone installation scripts are installing both erp5 software release and apache-frontend software release (the backend and the frontend) so you don't need to install anything else. If your machine has a public IPv4, the apache-frontend will listen on this IPv4 so your ERP5 is directly accessible from outside.

Also, for information, the slapos philosophy is to build everything from source, so you won't see anything installed through packages (except slapos and ansible and all their dependencies). All the softwares are installed under /opt/slapgrid and all the services are running inside partitions under /srv/slapgrid.
